Phase 4a: Examples of scenarios for user tasks

Task 2 – One user scenario, the administrative staff logs in, and is redirected to their respective dashboard. In the dashboard there are present two options – the notification settings option and the announcements option.

For the notification settings, a menu is shown that has "send a message to all students" and for the announcements, a menu is shown that has "create new announcement".

The admin clicks on the „create new announcement“, creating a new page called "Event details" where a new event can be added. The event has a time, date, location, course. The admin fills these fields and then presses submit for a new event to be added.

This event can be viewed by all undergraduates in the „important announcements" section from that respective course.

Task 5 – A second user scenario, the undergraduate logs in, and is redirected to their respective dashboard. In the dashboard there are courses presented, the courses the user studies.

If a user select a course, a new page is created with lecture cancellations, new assignments, important announcements

By clicking on the important announcements button, the last 5 made announcements by the admin are shown for the respective course with their date, time, location.
